**Assignment 0219 Feedback**

Haley Young

**CSI: OS**

*3a* — Excellent evidence-gathering! You nailed pretty much everything that I expected. One minor exception is that, for the first process on Windows, there is actually a process with ID 0; its name is System Idle Task or something like that. Dig around a bit more and you'll see it. Nevertheless, your thought process in finding your own evidence is sufficiently sound. (+)

**System Call Practice**

*2d* — Everything works as intended. Well done! (+)

*4a* — No problems with functionality here. One usage note—you specify in the comments that `reboot.c` must be `sudo`'ed, and that's a good thing. But even better, it would not have been too hard to do some nominal error handling so that if this is not done under `sudo`, a message appears to that effect. Right now it just "fails quietly"—a distinctly non-Unix-like thing to do. (+)

*4b* — Not much here with regard to separation of concerns, but nothing egregious either. (|)

*4c* — No code readability issues here. (+)

**Both**

*4d* — Both assignment portions show excellent resource/information use. (+)

*4e* — Your work is paced well with good commit messages. (+)

*4f* — Submitted on time. (+)
