Assignment 0205 Feedback

Haley Young

1a — You show significant adeptness with the command line, but you occasionally missed fully minimizing your output in order to get precisely the desired information only. You did do that most of the time though; just a couple of misses (particularly the memory ones). (**+**)

1b — You largely worked with processes and memory usage well, except for needing another piped command to narrow your output to *exactly* the information you needed (as mentioned). For your virtual memory answer (*answer3virtual.txt*), your commands seem to have dropped the process name—looks like you might need to tweak your command a little bit. (**|**)

1c — Your file activities look good across the board. (**+**)

1d — You showed good proficiency with managing I/O throughout. The one (tiny) area for improvement is the way you documented your `screen` adventures—those two screenshots don't clearly show that you took them within `screen` and that you detached/reattached from that session. They could have easily been a "normal" terminal window running `ping`, taken a few minutes apart. Fortunately, the instructions that you wrote down showed that you did things right. (**+**)

1e — You have shown that you have no problems interacting with computers across a network. (**+**)

4d — You generally did a good job with looking up necessary information. Good job with clearly recording your sources, too! (**+**)

4e — You phased your work very well, with good commit messages. Something for you to look into: I had trouble opening the most recent commit of *processSurvey.docx*. Fortunately, the version right before that can be opened, so I reviewed that instead, and inferred your virtual memory work based on what was *answer3virtual.txt*. If you can open this file, no problem; it might just be something on my end. (**+**)

4f — Submitted on time. (**+**)
